# Oregon State Ichthyology Collection
HOW TO GUIDE- Entering card records

Step 1: Search Specify to see if this record has already been entered. A) If results appear, check to make sure they are the same as what is on the card and mark the card with a sharpie on the edge of the card above where the catalog number is written if it is not already. ALWAYS CHECK EVEN IF THE CARD IS MARKED. B) If nothing comes up, continue to STEP 2
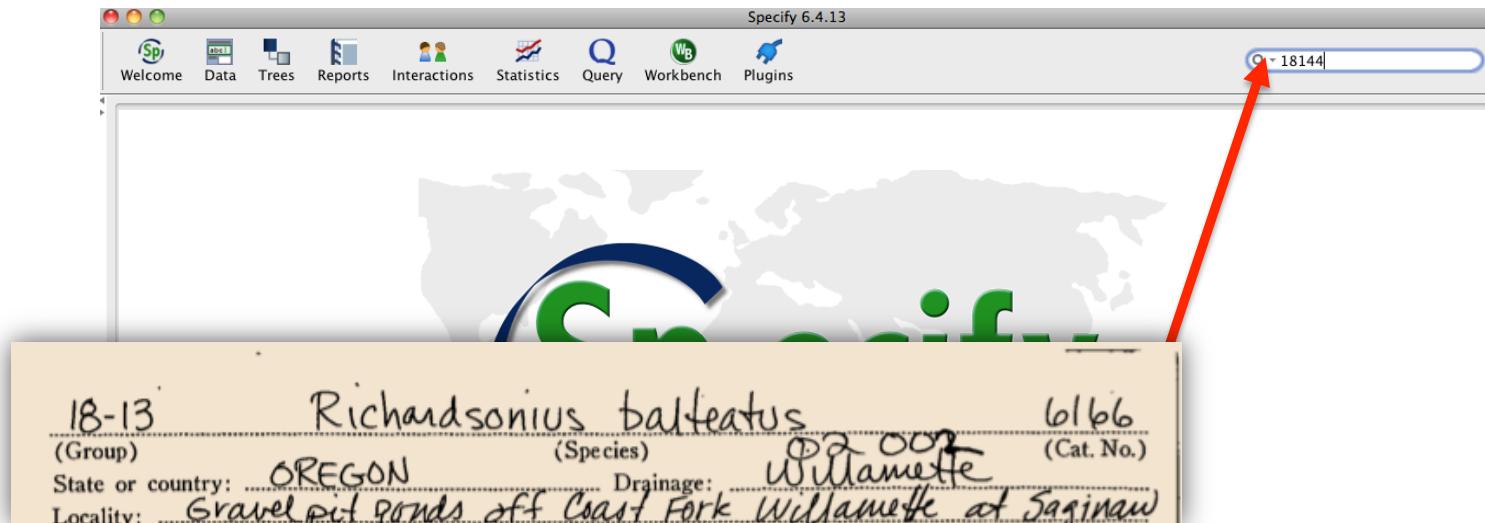

Step 2: To create a "new" collection object for the card in Specify, select the Data icon and then click on "Collection Object" underneath the Create/Update field on the left.
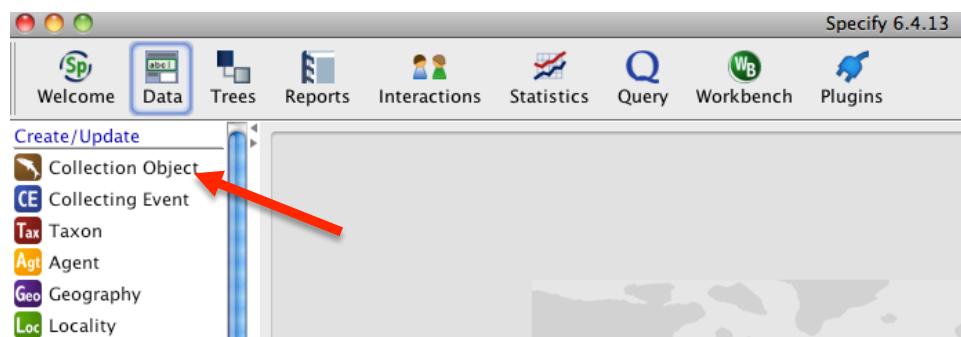

Oregon State Ichthyology Collection
HOW TO GUIDE- Entering card records

Step 3: Collection Object data section

1) Enter the catalog number
2) All card catalog material gets the "2009-IC-001" accession number
3) Search the original cataloger's name in the Cataloger section by entering the first few letters of the last name and pressing the ⇩ key. If nothing comes up, create a new record for that cataloger. If only the initials or only a first name comes up, but this matches exactly what is on the card, assume that the name on the card represents the same individual that is already in the database.
4) KEEP today's date as the cataloged date (since the original cataloged date was not recorded)
5) Record verbatim anything written in the "Remarks" section on the card in the Remarks field

Step 4: Determinations section

1. Enter the species name in the "Taxon" field. Start by entering the first few letters of the genus, then press ⇩ to search our name database. If no match comes up, search the Catalog of Fishes (**See Appendix 1: Catalog of Fishes**) to see if this species name has been moved to a different genus or synonymized. Use the most current taxonomy available, but note that if you updating taxonomy in the database you will also need to print a new label for the specimen jar. **(See Appendix: Printing Labels)**
2. In most cases, the Confidence and Type Status will be left blank.   If there a question mark or a "cf." designation in the species name, select "questionable" from this menu.
3. If a determiner (usually det. Is written before their name) or identifier is provided on the card, enter this in the determiner section. If not, leave this section blank.
4. Enter the date of determination in the ID Date field. If not provided (this is often the case), leave it blank.

Step 5: Collecting Event

1) Search the Collecting Event section to see if the "Field No." on the card or a field number created for the collector (see **Appendix 2** for info on creating field numbers) exists in the database. If you find a matching field number in the database, check it using the pencil (edit) icon to verify that the information is the same as that on your card and proceed to **Step 6.** If not, proceed to **Step 6a.**

Oregon State Ichthyology Collection
HOW TO GUIDE- Entering card records

Step 6a: Creating a new Collecting Event

2) If no Collecting Event exists for this record, create a new one by pressing the + icon to the right, which will open the Collecting Event window
3) If the card has a field number on it, enter it. Otherwise, create a Field Number- see **Appendix 2: Creating Field Numbers**
4) Select how the field number was made from the drop down (either from the original field notes or created during cataloging).
5) Usually a card only provides one date, enter this as the Start AND End date.
6) Enter time if provided: note that we use a 24-hour clock.
7) Select a collecting method from the drop down. If the method is not listed choose other or the closest match. Then, elaborate in the Method Detail field
8) Enter any remarks related specifically to the collecting event- Dist off Shore and Width Fields on card or other info
9) Search the Locality Field to see if the locality has already been entered. BE SURE to type out verbatim what is written on the card, but to check to discrepancies of the same site, search the first few words. If something comes up, make sure it is exactly the same as what is written on your card, including the latitude and longitude coordinates, before selecting it. If the locality does not appear in the database, proceed to **Step 6b.**

(Front)

Oregon State Ichthyology Collection
HOW TO GUIDE- Entering card records

10) Enter any Collecting Events Attributes provided on the card. The most frequent fields are: a) Velocity b) Min and max water depth c) Water and air temperature (note that these are separate fields) d) substrate, and e) Vegetation. Enter any other info that doesn't fit obviously into these fields in the Attribute Remarks. Velocity should be recorded in meters/second, depth in meters, and temperature in degrees Celsius. Convert these values as needed.

(Front)

11) Enter the collectors in the Collectors Field by pressing the + icon, use the down arrow search to see if the last name is already present. Add ALL collectors listed in the order listed. You'll need to enter them one at a time.

12) Ignore the Collection Objects field: it fills in automatically.
13) Now, you are done! Save the new Event.

Oregon State Ichthyology Collection
HOW TO GUIDE- Entering card records

Step 6b: Creating a new Locality

1) Click the + symbol to the right of the Locality field to add a new Locality.
2) Enter what is written in the Locality <u>verbatim</u>, however, if there are any misspellings of locations (checked via Google) make a remark in the collecting events section.
3) Search the geography field for the MOST SPECIFIC geographic reference provided on the card (usually county in the US) or equivalent in other countries. If nothing comes up see **Appendix 3: Matching Localities**.
4) Enter any Lat Long data using the dropdown menu to select the correct format (Note in this example, the Lat Long is more specific than the card because this site was used by multiple collecting events). Old records often have information in degrees/minutes/seconds. Records generated after GPS technology became prevalent usually use decimal degrees.
5) Use the + to add any Locality Details provided on the card, <u>usually just Drainage.</u>
6) <u>For localities in Oregon, we have formalized a set of drainages (**see Appendix 4: Drainages**), so be sure to set the drainage to match one of those categories. For other freshwater localities, enter the appropriate major river system. For example: Fraser, Snake, Orinoco, Amazon, Essequibo.</u>
7) Save the Locality.
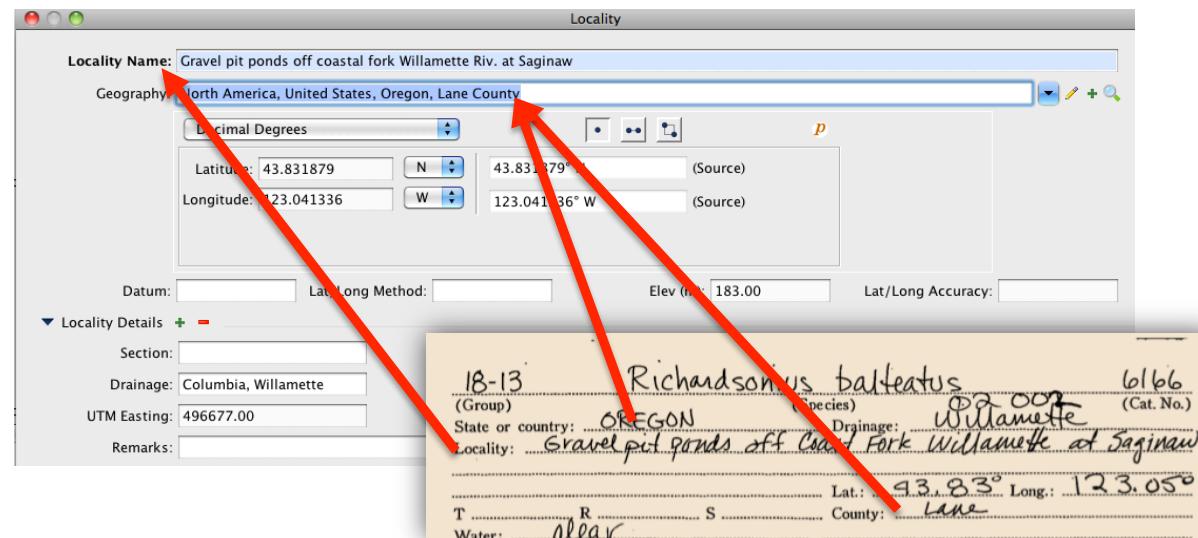

(Front)

Oregon State Ichthyology Collection
HOW TO GUIDE- Entering card records

Step 7: Preparations

1) Press the + symbol to add new preparations information
2) Select the preparation type from the drop down. The most common are isopropanol, ethanol, cleared and stained, and (dry) skeletal.
3) Add the number of specimens in the count field (upper right corner on back of card)
4) Enter the storage medium in the Stor Med section. For most cards it will be some concentration of isopropanol. The cards will usually read between 36.5 and 45%, but WE HAVE STANDARDIZED THESE TO 50% in the bottles on the shelves, regardless of the concentration on the card. If other solutions are provided, such as formalin or ethanol, use those as appropriate.
5) Rarely, the preparation date will be provided, add this in the specific field. Usually, ignore this field.
6) If the specimen is in a tank, add that information in the Storage field. The specific tank designations are listed in the Storage tree (available from the trees icon in the header bar)

(Back)

Oregon State Ichthyology Collection
HOW TO GUIDE- Entering card records

Step 8: Collection object attributes
1) Press the + symbol to add new collection object attribute data
2) Sometimes, the card may provide information for the fields in this area- check for this
3) Usually, the only data provided for this field is a range of standard lengths or SL. If only one length is provided, add this as the Min SL. If a range is provided, give the min and max as shown below. If lengths are provided in any unit other than mm, convert to mm.
4) If tissues are associated with a lot, list ALL tissue numbers separated by commas. This allows searches for particular tissues.

(Back)

Step 9: Final check
1) Now, you are almost done. Check the record in Specify to make sure you have entered data for all of the correct fields.

2) **HIT SAVE in the lower right corner!**

Oregon State Ichthyology Collection
HOW TO GUIDE- Entering card records

GLOSSARY

Agent: Any person performing a role in the collection. An agent may serve in different roles at different times, such as cataloging one object, preparing another, and determining a third.

Collecting Event: A specific occasion (date and time) at which agents collected specimens at a locality.

Collection Object: Any cataloged item in the collection. This might be a jar of fish specimens in alcohol, a skeleton or even a photograph or x-ray. Note that there can be more than one individual organism and more that one preparation associated with a collection object, though all will be the same species, collected at the same locality during a single collecting event.

Determination: The taxonomic identification attached to a collection object.

Determiner: The person who identified a collection object.

Field Number: The number that identifies a collecting event. In modern collections, this is the code that the collector used in their field notes. For historical parts of the collection, this is a string reflecting the primary collector, year and collection (see appendix on creating field numbers). Specify uses field numbers as the primary search field for collecting events.

Geography: A classification of regions of the globe to which localities are tied. For freshwater collections, geographies are classified according to continent, country, state and county.   For oceanic collection, geographies are classified according to oceans and increasingly restrictive subsets of those oceans.

Locality: A specific place on the globe, typically identified by a unique set of latitude and longitude coordinates and a textual description.

Preparation: A type of object in the collection, such as a fluid-preserved specimen, a skeletal preparation, a cleared and stained specimen or an otolith.

Preparer: The person who preserved, skeletonized or photographed the preparation.

Taxon: Any element of the Linnean taxonomic hierarchy, such as class, order, family, genus or species.   Most frequently you will be working with Genus-species combinations (the scientific name of the species).

Appendix: Creating Unique Field Numbers

Field numbers are an excellent way of searching a database for objects. Many of the older collection objects do not have an original field number associated with them; therefore, it is often beneficial to create unique numbers to both aid in database queries and quickly linking objects taken during the same collecting event without duplicating the event in the database.

In OSIC, a general template is used to create new field numbers that are both unique and provide information about the event with just a glance. These numbers are broken into thirds and are comprised of the following parts separated by a dash (-): Collector - Locality and Year - Unique Identifier.

- The first two or three letters of the number are the initials of the lead collector. If there is no collector on file, this first portion is omitted.
- The second third of the number is the locality and the year. The locality should be expressed as the postal abbreviation for the state or territory for all US localities. At the end of this tutorial, a list of non-state US territories is provided. All non-US localities should use an easily recognizable abbreviation of the country. These abbreviations should be formatted with the first letter capitalized followed by two or three lowercase letters. For example, the country abbreviations for Japan, China, Russia, Iraq, and Iran are Jap, Chn, Rus, Irq, and Irn respectively. Attached to the two or three letter locality code should be the last two digits of the year. For open ocean localities, use an abbreviation of the body of water.
- The final portion of the field number is a unique identifier to distinguish between various collecting events conducted by the same collector, in the same locality and year. For most events, adding an A, B, C,… should be sufficient, however some slightly more complex identifiers are often needed, as seen in the second and third examples below.

[INITIALS] - [STATE or Country][last two of year] - [A,B,C,…etc or another unique random identifier]

Examples:

- Unknown collector with locality listed as "off AL-MI-FL", 1976
  - Unkw-GoMx76-A
    - Note that the locality was switched to body of water, Gulf of Mexico, to accommodate geographic inaccuracy.
- Carl E. Bond, Oregon, 1951, First event cataloged under CEB-OR51-
  - CEB-OR51-A
- Jim Long, Alaska, 1980, *F/V Half Moon Bay* /Haul#44
  - JL-AK80-HMB/H#44
- Jim Long, Alaska, 1980, *F/V Ocean Harvester* /Haul#44
  - JL-AK80-OH/H#44
  - ➢ In these instances, the letter designations A and B are replaced with unique identifiers; Vessel name initials are used in conjunction with the haul numbers to differentiate between hauls made in the same year by multiple vessels used by Jim Long during this time, the *F/V Ocean Harvester* and the *F/V Half Moon Bay.*

Non-state US postal codes

APPENDIX: DRAINAGE DESIGNATIONS FOR OREGON
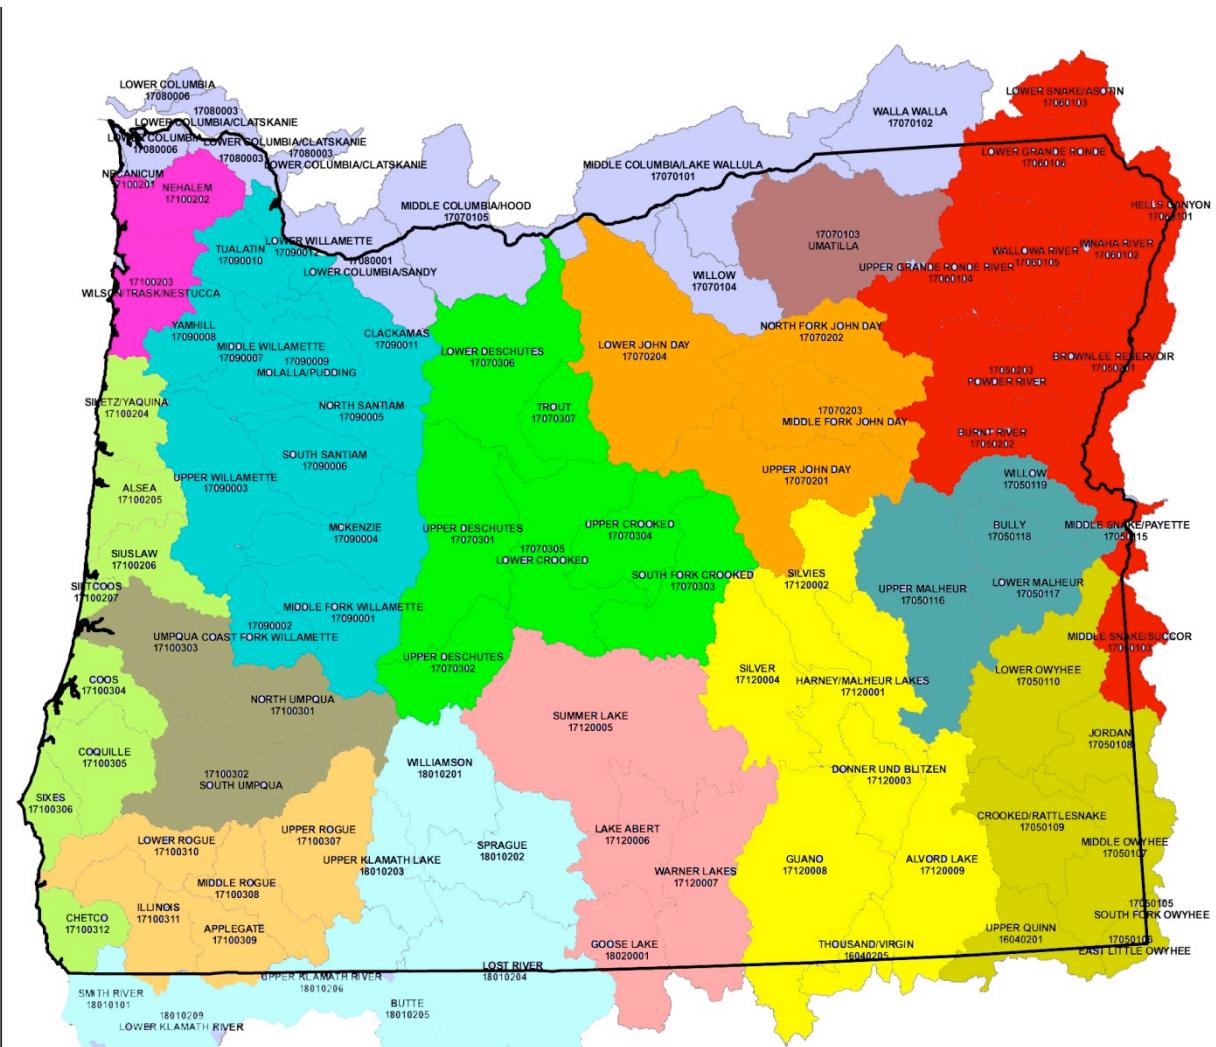

All Oregon freshwater collections should be assigned to one of the 15 "major drainages" used in the database. This map shows the 8 digit HUCs for Oregon, color-coded to the 15 "major drainages". The drainage hierarchy used in the database is a legacy hierarchy of convenience. The "major drainages" are:

Columbia – mainstem Columbia River and "minor" tributaries on the state's northern border.

Columbia, Willamette – Willamette River and its tributaries

Columbia, Deschutes – Deschutes River and its tributaries

Columbia, John Day – John Day River and its tributaries

Columbia, Umatilla – Umatilla River and its tributaries

Columbia, Snake – mainstem Snake River and "minor tributaries on state's east-northeast border

Columbia, Malheur – Malheur River and its tributaries

Columbia, Owyhee – Owyhee River and its tributaries, including the Quinn River drainage which is technically Lahontan

Inland, Malheur Lakes – interior drainages of Harney Basin, Alvord and Guano valleys

Inland, Oregon Lakes – interior drainages of Warner, Goose and Summer lakes

Klamath – Klamath River and its tributaries

Rogue – Rogue River and its tributaries

Umpqua – Umpqua River and its tributaries

Pacific, South Coast – coastal drainages south of the Salmon River (northern border of Lincoln County) but excluding the Rogue and Umpqua rivers

Pacific, North Coast – coastal drainages from Neskowin Creek (southern border of Tillamook County) north to Necanicum River
