

# Digitizing Collections Worldwide

*in support of 22<sup>nd</sup> century entomology (sooner)*

Deborah L. Paul, Florida State University, iDigBio  
Eastern Entomological Society of America Meeting  
Symposium: The Digital Future of Entomology  
10 March 2019

@GoodStickLtd

# Overview of this talk

Your part in helping entomology specimens, data, and people take 22<sup>nd</sup> century journeys

## 4 main areas

- worldwide
- skills and literacy
- data use
- metrics

*Acanthagrion quadratum*

## 3 main points

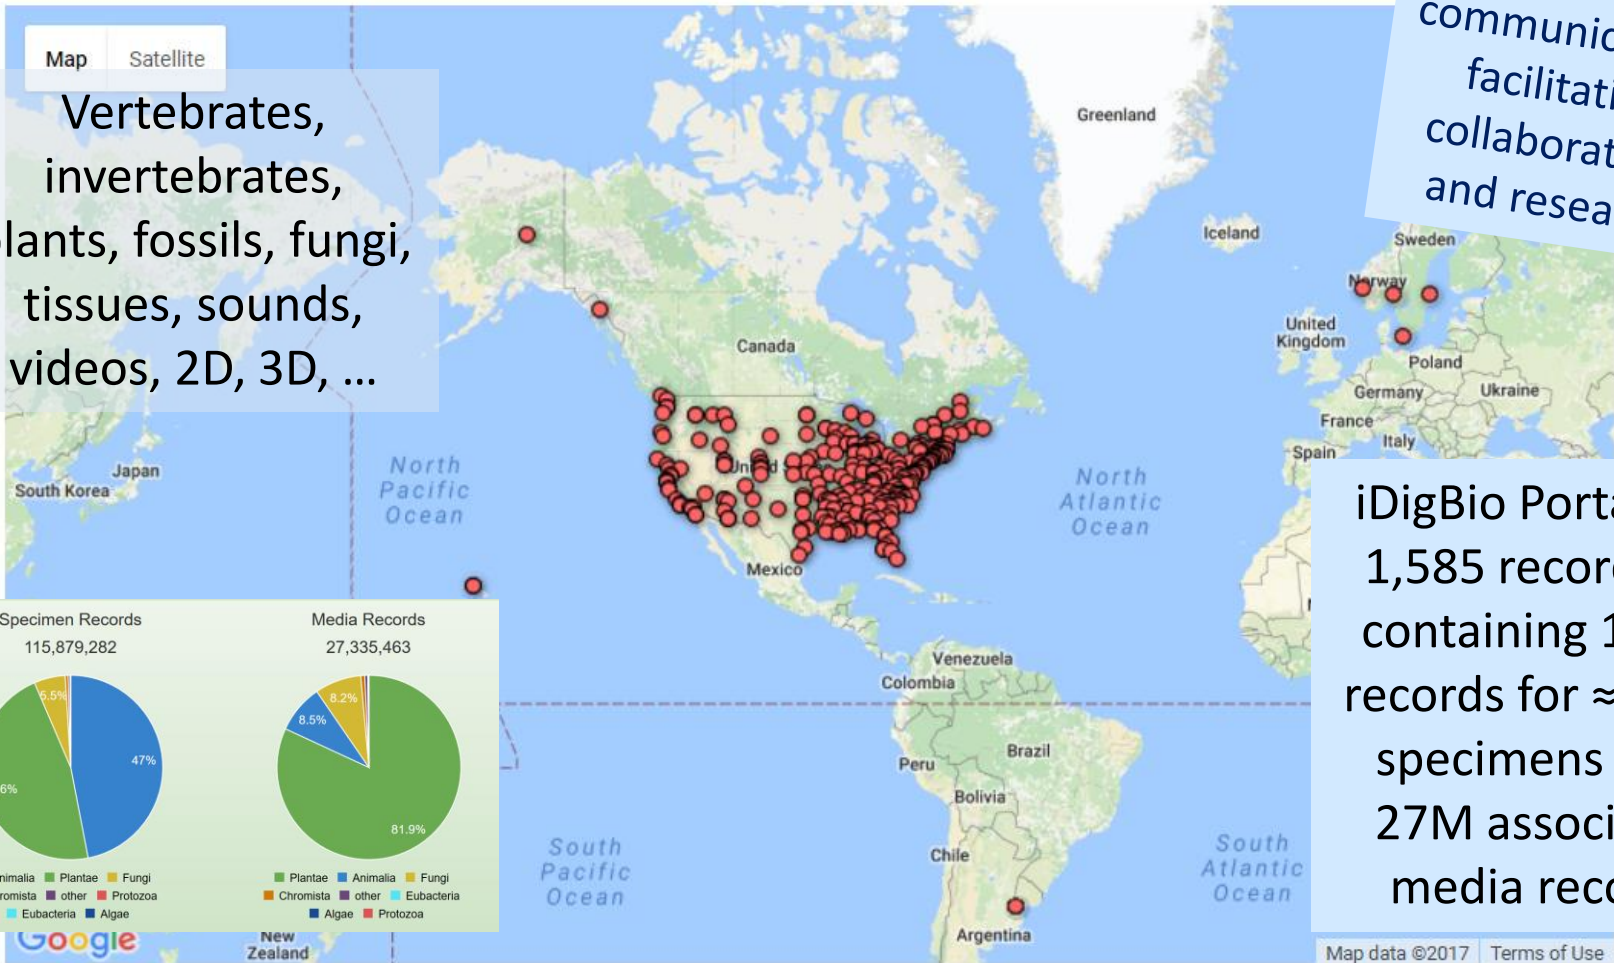

- local to global change
  - in practice and in policy
  - collecting, citation, workflows, access, ...
  - contribute and be prepared
- capacity building needs
  - how can you be part of the solution
  - share
- foster use of the data
  - GBIF Science Ambassadors

# Advancing Digitization of Biodiversity Collections (ADBC) National Digitization Network iDigBio and the Thematic Collection Networks (TCNs)

Developing networks, enhancing communication, facilitating collaboration, and research

Vertebrates, invertebrates, plants, fossils, fungi, tissues, sounds, videos, 2D, 3D, ...

iDigBio Portal has 1,585 recordsets containing 115M records for  $\approx$ 345M specimens with 27M associated media records

750 participating collections in 411 institutions (23 TCNs + 29 PENs)

Distributed System of Scientific Collections

**115** National Facilities  
**21** Countries

a new business model:  
**ONE EUROPEAN COLLECTION**

- Largest ever formal agreement between natural science collection facilities
- A system of distributed facilities
- Centralised shared governance model in place
- Supporting network of **working groups**
- One European Collection of scientific assets
- Common Collections development strategy
- Economies of scope and scale
- Monitoring impact of collections (documenting ROI)
- Specialisation strategies (e.g. in alignment with national priorities, e.g. Smart Specialisation Strategies)
- Joint Research Agendas

# Collections Biodiversity Data – expected and emerging uses

## Important Human Issues

- Evolutionary medicine,
- Disease discovery, tracking, and treatment
- Food security,
- Biodiversity conservation and sustainability,
- Computation,
- Design,
- Evolution and justice,
- Development of new types of biodiversity theories that accommodate newly emerging data streams.

## Emerging Research Angles

- Supplementing existing datasets with digital layers to enhance niche and species distribution modeling,
- Use of 3D/CT data for generating and testing new hypotheses,
- Implementation of convolutional neural networks (CNN) and deep learning in the analysis of image,
- Data for taxonomic determination and specimen curation,
- Delineation of traits in specimen images,
- Determination and identification to genus or species from, sediment-deposited pollen grains.

## Museum and Herbarium Collections for Biodiversity Research in Angola

Figueira R., Lages F. (2019). In: Huntley B., Russo V., Lages F., Ferrand N. (eds) Biodiversity of Angola. Springer, Cham <https://doi.org/10.1007/978-3-030-03083->

- helping nations to aggregate their own biodiversity resources currently distributed outside their borders (justice)
- taxonomy
- chaos prevention
- preserving and documenting biodiversity
- detecting changes in species distributions and in the environment
- biodiversity conservation
- supporting sustainable food production
  - weed identification, crop wild relatives conservation, control of damage caused by insects and fungi, seed bank collections, and wood samples
- connecting biodiversity to society through education

# 150 years in the making: first comprehensive list of the ants (Hymenoptera: Formicidae) of Virginia, USA

Kaloyan Ivanov, Liberty Hightower, Shawn T. Dash, Joe B. Keiper  
<http://dx.doi.org/10.11646/zootaxa.4554.2.8>

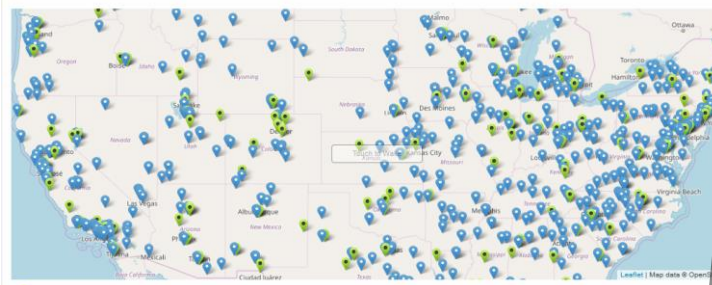

## Abstract

Due to Virginia's geographic location, topographic variability, and diversity of physiographic provinces, the state ranks as one of the most biodiverse areas in the US. Virginia's myrmecofauna, however, has been insufficiently studied and is not well known. Here we present the first comprehensive list of the ants of Virginia and provide county-level distributions for all taxa. With taxonomic updates taken into account, review of published records revealed that 130 species have been reported from the state. We add another 34 species based on newly collected materials, review of museum and personal collections, and online databases. At present, 164 species and morphospecies, including 15 ant exotics, are known to occur in the state. Another 12 species are provisionally excluded from the list as they represent distribution anomalies, or are based on erroneous records. The work presented here is an initial step towards a more complete treatment of the identification, taxonomy, and natural history of the ant fauna of Virginia.
