Harvard Embryological Collection

- FMNH: ~400,000 slides, including 10,000 type specimens.
- HUH: >15,000 slides of wood anatomy, fungi, diatoms, insect pests, etc.
- USNM: >2,300 types/paratypes on slides and >10,000 histological slides just in IZ; Wever collection, 83,672 slides.
- Cornell: plant anatomy collection, >120,000 slides; Northcutt neuroanatomy and embryology, ~35,000 slides.
- BMNH: ~2.4M slides.

What is Girder?

Girder is a free and open source web-based **data management platform** developed by [Kitware](#) as part of the [Resonant data and analytics ecosystem](#). What does that mean? Girder is both a standalone application and a platform for building new web services. It's meant to enable quick and easy construction of web applications that have some or all of the following requirements:

Semi-Automated Slide-Scanning Workflow

Consolidated cabinet

Removing film and particulates (soot)

Inserting slides into custom slide holder

Loading slide holder into 10-capacity autoloader of Huron scanner

Queued Slideholders

Currently Scanning:

Tray142_1

Slot 5: 30%

Slot	Slideholder Id	Scan Order	Timestamp	Status
------	----------------	------------	-----------	--------

6	Tray142_2			
---	-----------	--	--	--

Batch-process

- Image file: ~ 2.5 Gb per slide (1½" x 3").
- Scan time: ~ 25 min per slide.
- Maximum 80 slides per run.
- Preferred run = 42–45 slides in 5–6 holders: total scan time ca. 17½ hr plus 2 hr setup. Start at midday, finished by the next morning.

Completed Slideholders

Slideholder Id	Timestamp	Path
Yirong_28

Cornell University Plant Anatomy Collection

CUPAC(Cornell University Plant Anatomy Collection) is an historically important collection of anatomical slide preparations of a wide array of plant parts. These slides include materials prepared by renowned Cornell Plant Anatomists, both for teaching and publication. Included are slides from the collections of [Arthur Fames](#), Mary Wilde, David W. Bierhorst, [Hal Moore](#) and Natalie Uhl; and from other famous plant anatomists such as K. Esau, Johri and Maheshwari.

Slides are being imaged by volunteers and undergraduate student workers, and simultaneously barcoded and databased. Post-processing involves automated resizing and labeling as well as magnification calibration that allows online measurement tools to be used as overlays on the images.

Search tools

IMAGE Keyword/Genus Search:

Above, you may use "and" and "or" and mix genus names and keywords like this: "Quercus and wood" or perhaps "Zamia or Cycas"

GENUS Search:

The genus search does not yet take "and-or" searches and must be an exact match for a genus

Index by [taxon](#).

Index by [image keyword list](#).

THIS PROJECT IS PARTIALLY SUPPORTED BY NSF AWARD CBR-7756 TO PIs GANDOLFO AND NIXON

Field Museum: Grainger Digital Initiative

Invertebrate Zoology

Virtual Microscopy

Search:

Taxa [phylum, subphylum, superclass, class, subclass, superorder, order, infraorder, family, genus, species, scientific name], common name, caption, author, identifier, or location.

Themes:

Select one of many preset "thematic searches" to explore similar concepts and specimens.

Browse:

Methods

A Novel Automated Mass Digitisation Workflow for Natural History Microscope Slides

E Louise Allan[‡], Laurence Livermore[‡], Benjamin W Price[‡], Orla Shchedrina[‡], Vincent S Smith[‡]

[‡] Natural History Museum, London, United Kingdom

Figure 2. [doi](#)

For the previous slide digitisation pilot batches of up to 100 slides were placed in a template and imaged using the SatScanTM.

“Here we describe a novel process of semi-automated mass digitisation using both temporary and permanent barcode labels applied before and during slide imaging. By using a series of barcodes encoding information associated with each slide ... we can run a series of automated processes, including file renaming, image processing and bulk import into the NHM’s collection management system.”
