

# Biogeographic filtering and the assembly of Neotropical rainforests

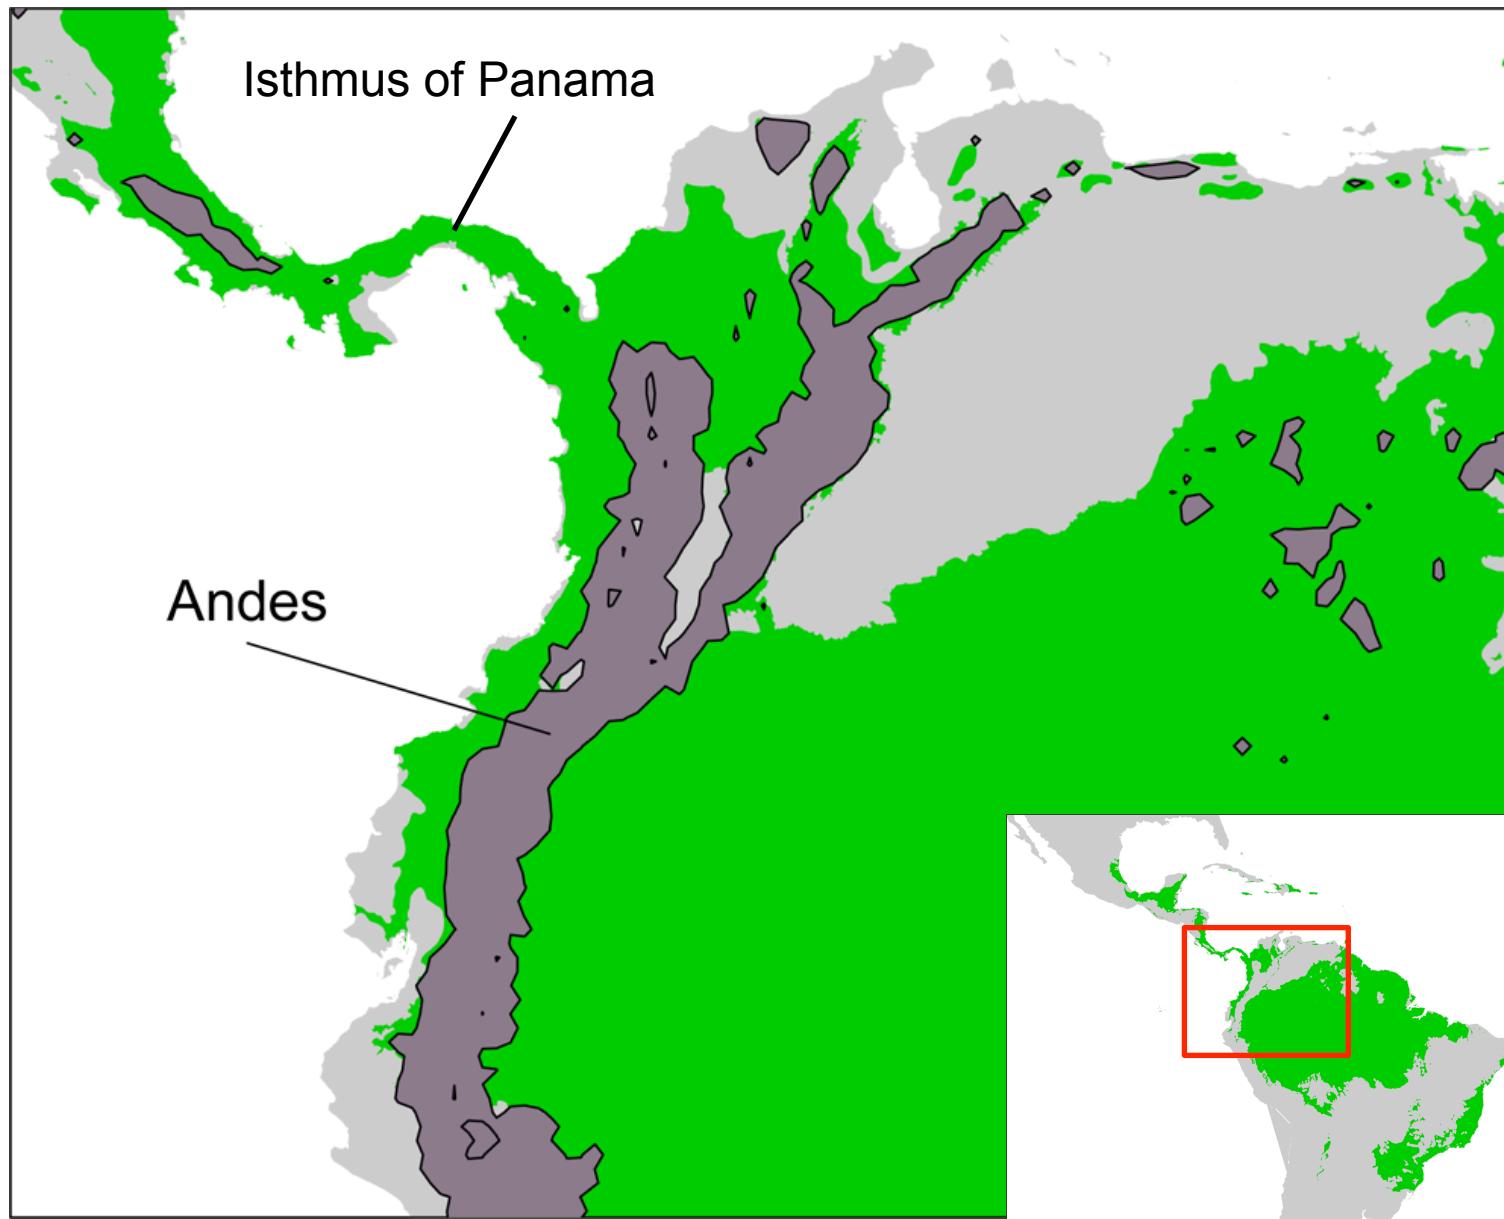

Insights using ecological traits derived from digital biodiversity data

Inaugural Digital Data in Biodiversity Conference, June 5<sup>th</sup> 2017

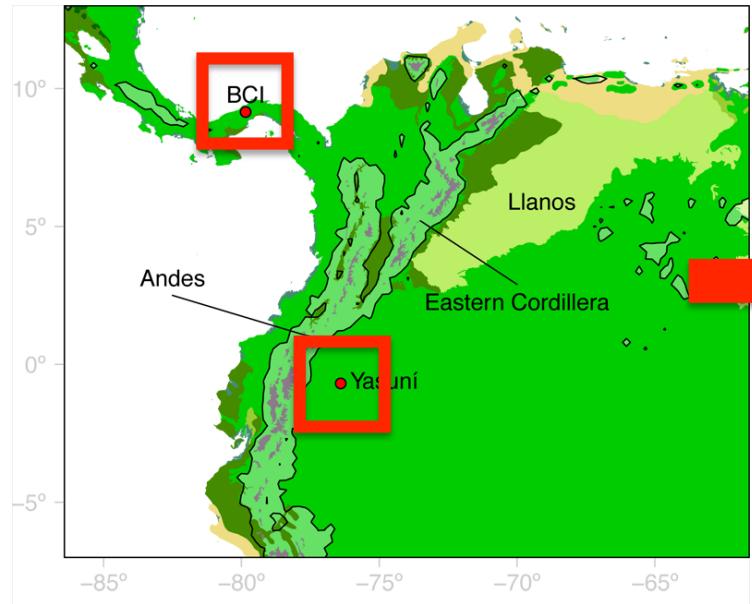

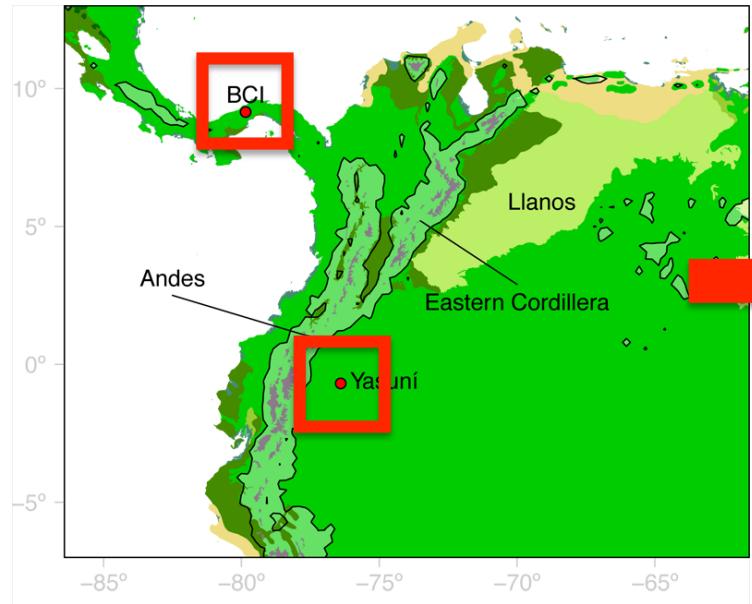

# Why are some rainforest woody plants widespread (across the Andes)?

- 1) Broad elevational range
- 2) High drought tolerance
- 3) High dispersal-colonization ability
  - Dispersal distance:
    - small seeds, large maximum height, wind dispersal
  - Rapid/pioneer life history (colonization):
    - low wood density, low leaf mass per area (LMA), small seeds, small maximum height

quality control

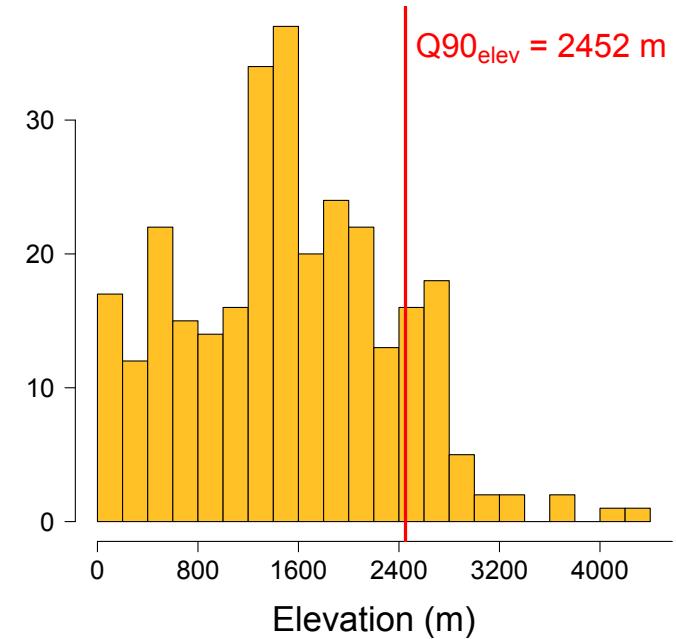

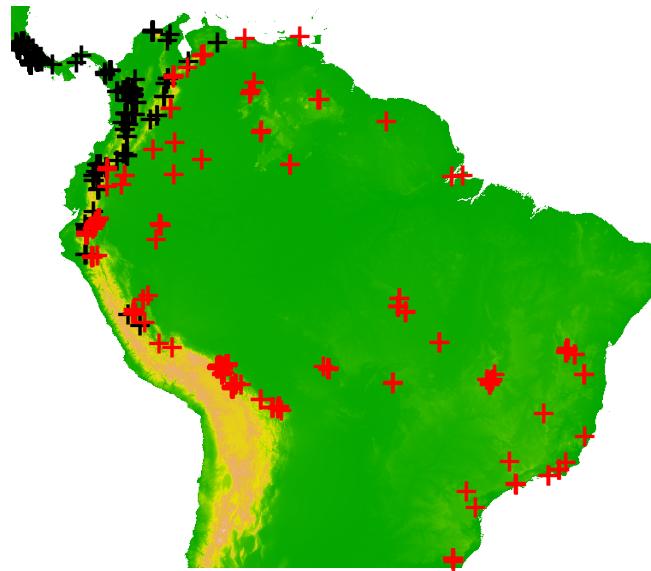

- 1) geographic distribution
- 2) elevational range
- 3) drought tolerance

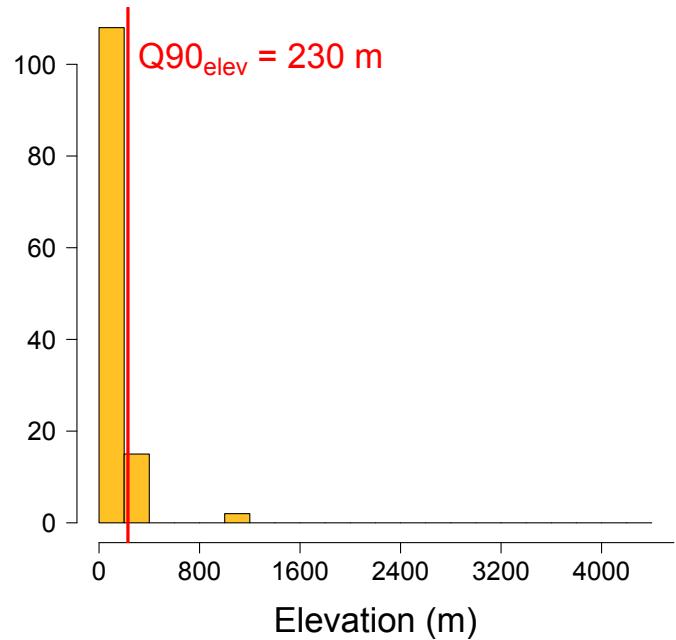

# Elevational range

*Gordonia fruticosa*  
(Theaceae)

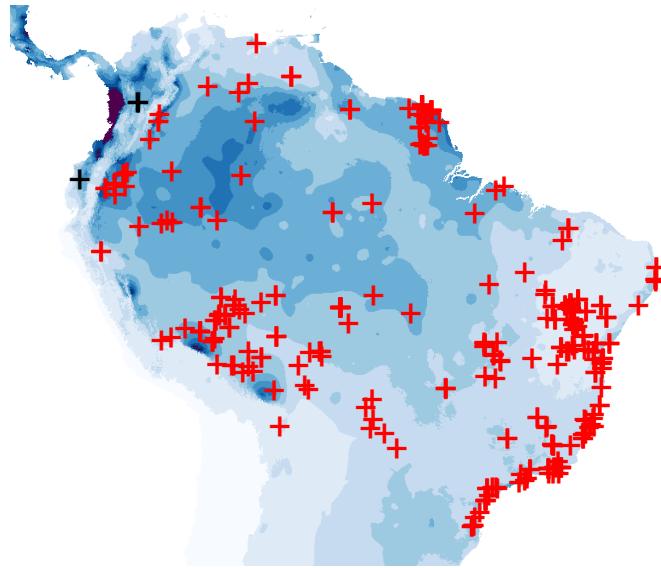

*Elaeolumma glabrescens*  
(Sapotaceae)

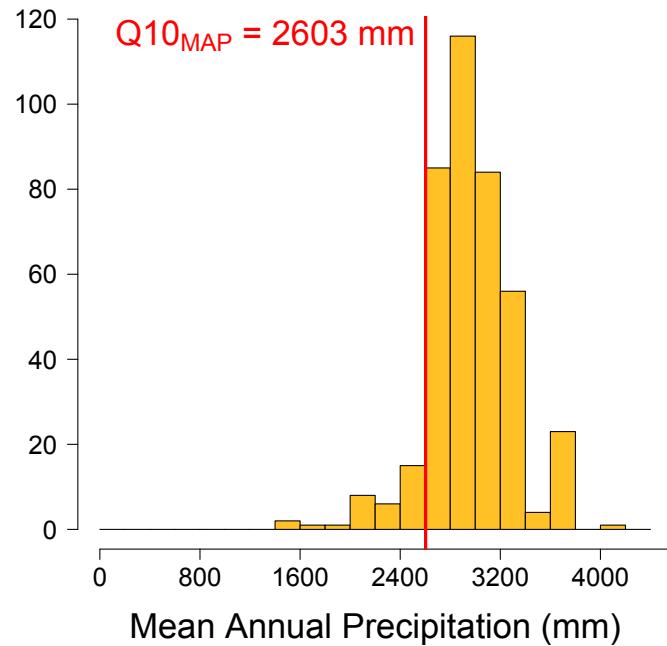

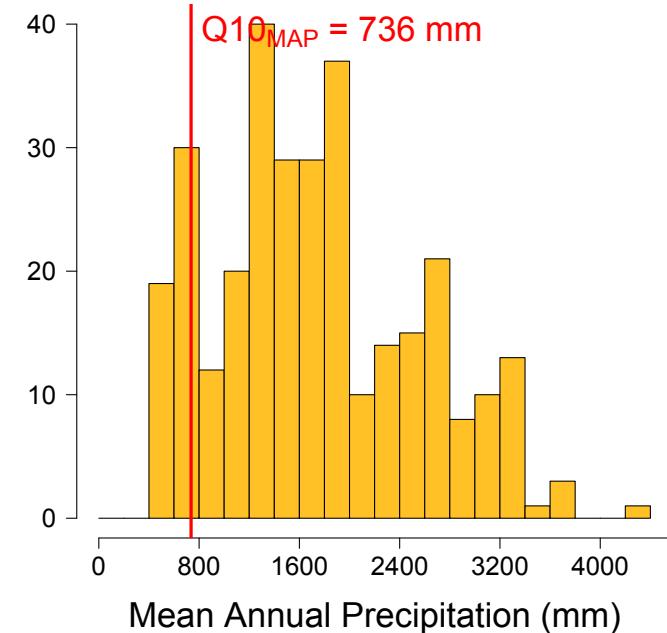

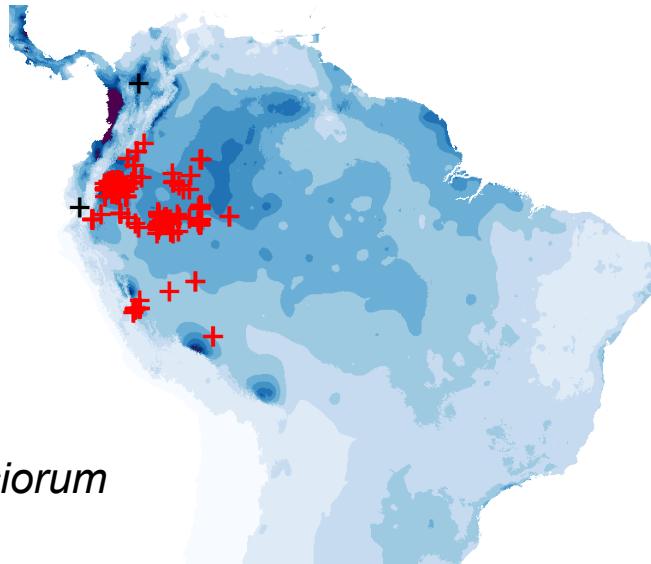

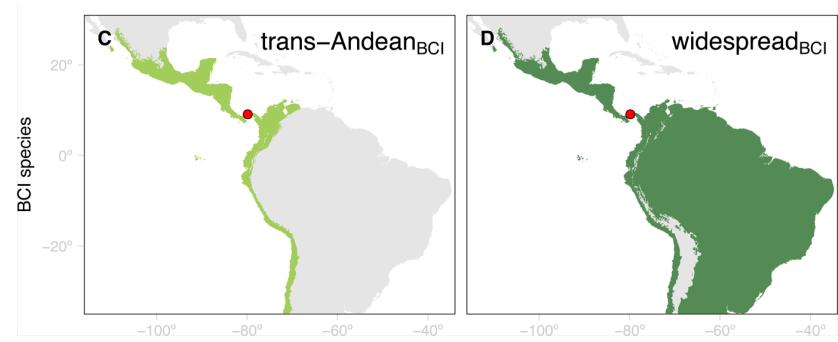

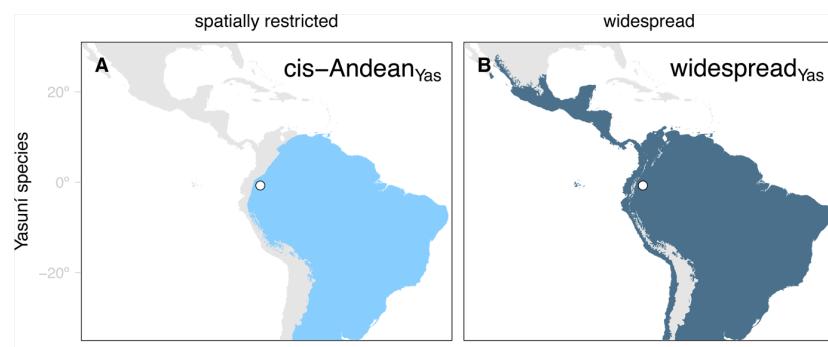

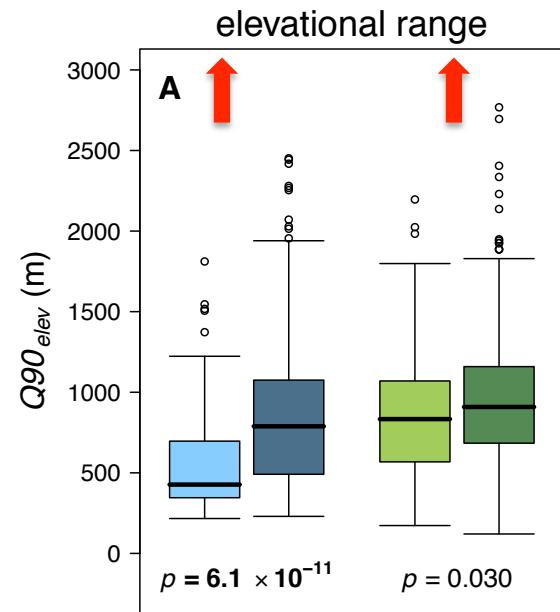

# Drought tolerance

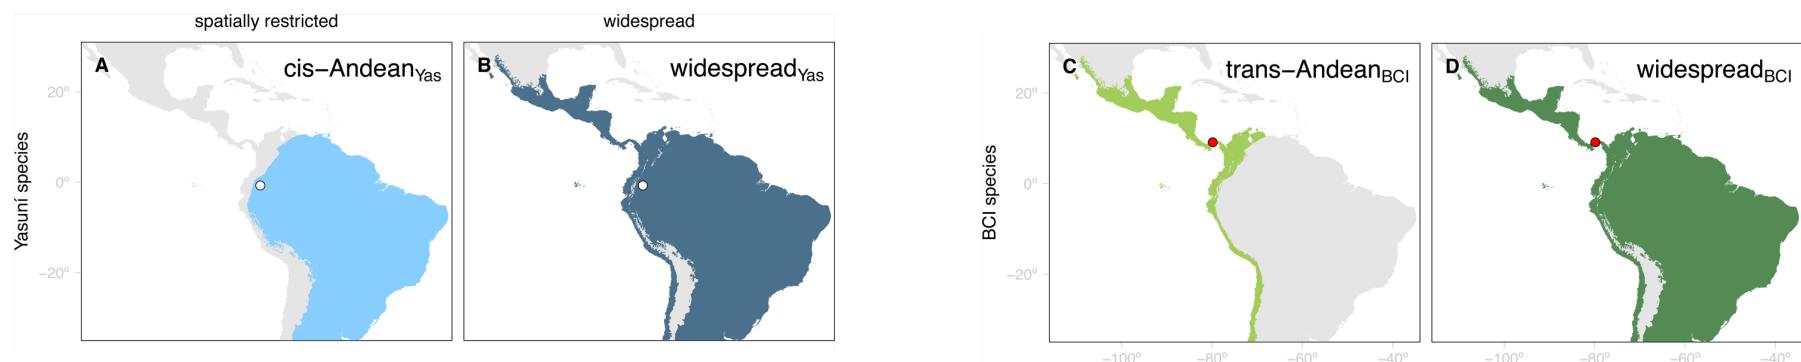

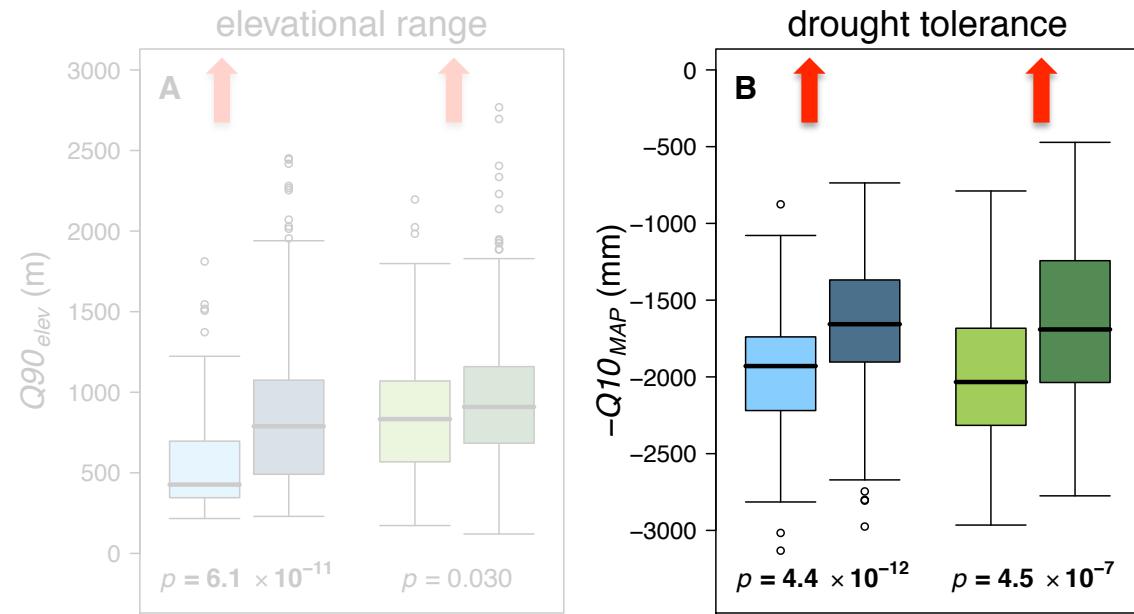

*Ficus gomelleira*  
(Moraceae)

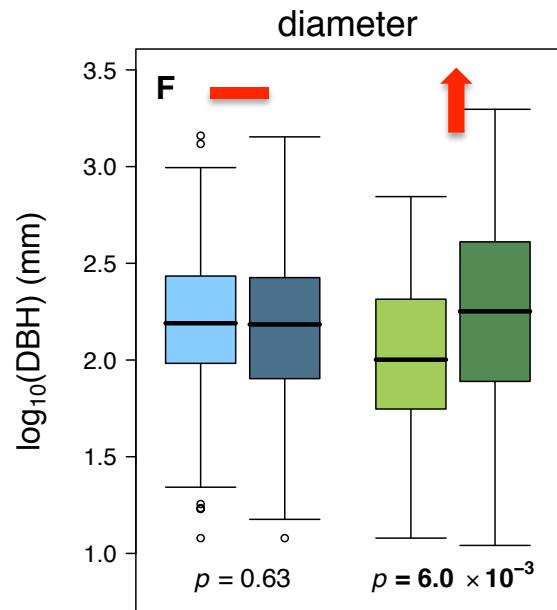

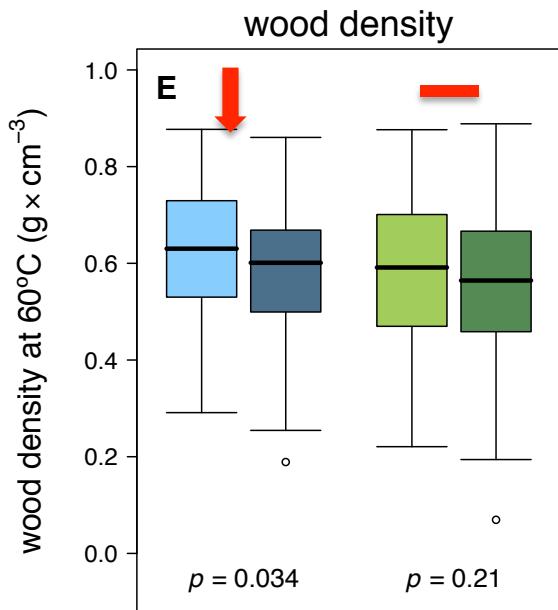

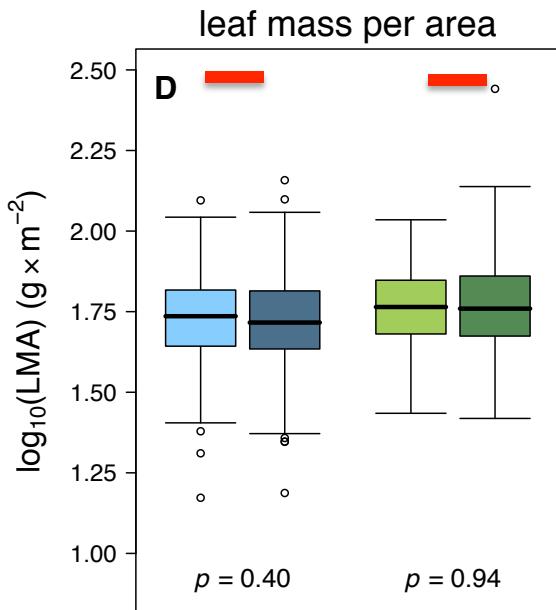

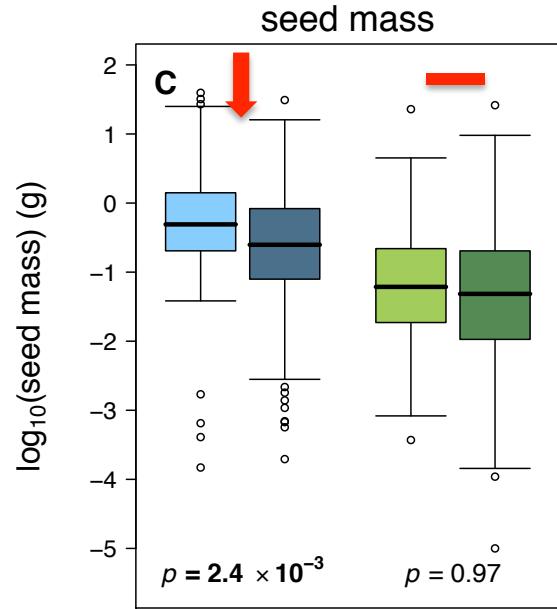

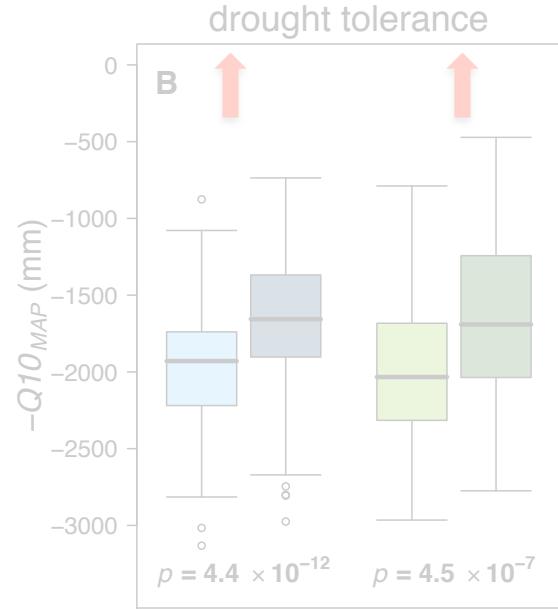

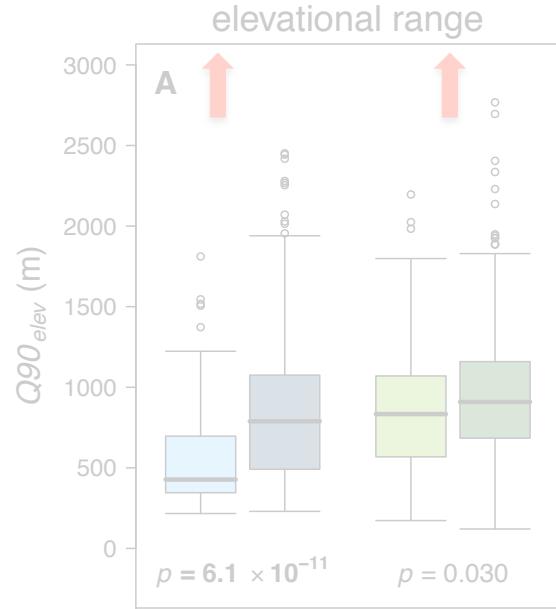

*Unonopsis veneficiorum*  
(Annonaceae)

# Why are some rainforest woody plants widespread (across the Andes)?

- 1) Broad elevational range 
- 2) High drought tolerance 
- 3) High dispersal-colonization ability  
  - Dispersal distance:
    - small seeds, large maximum height, wind dispersal
  - Rapid/pioneer life history (colonization):
    - low wood density, low leaf mass per area (LMA), small seeds, small maximum height

# Northern Andes biogeographic filter

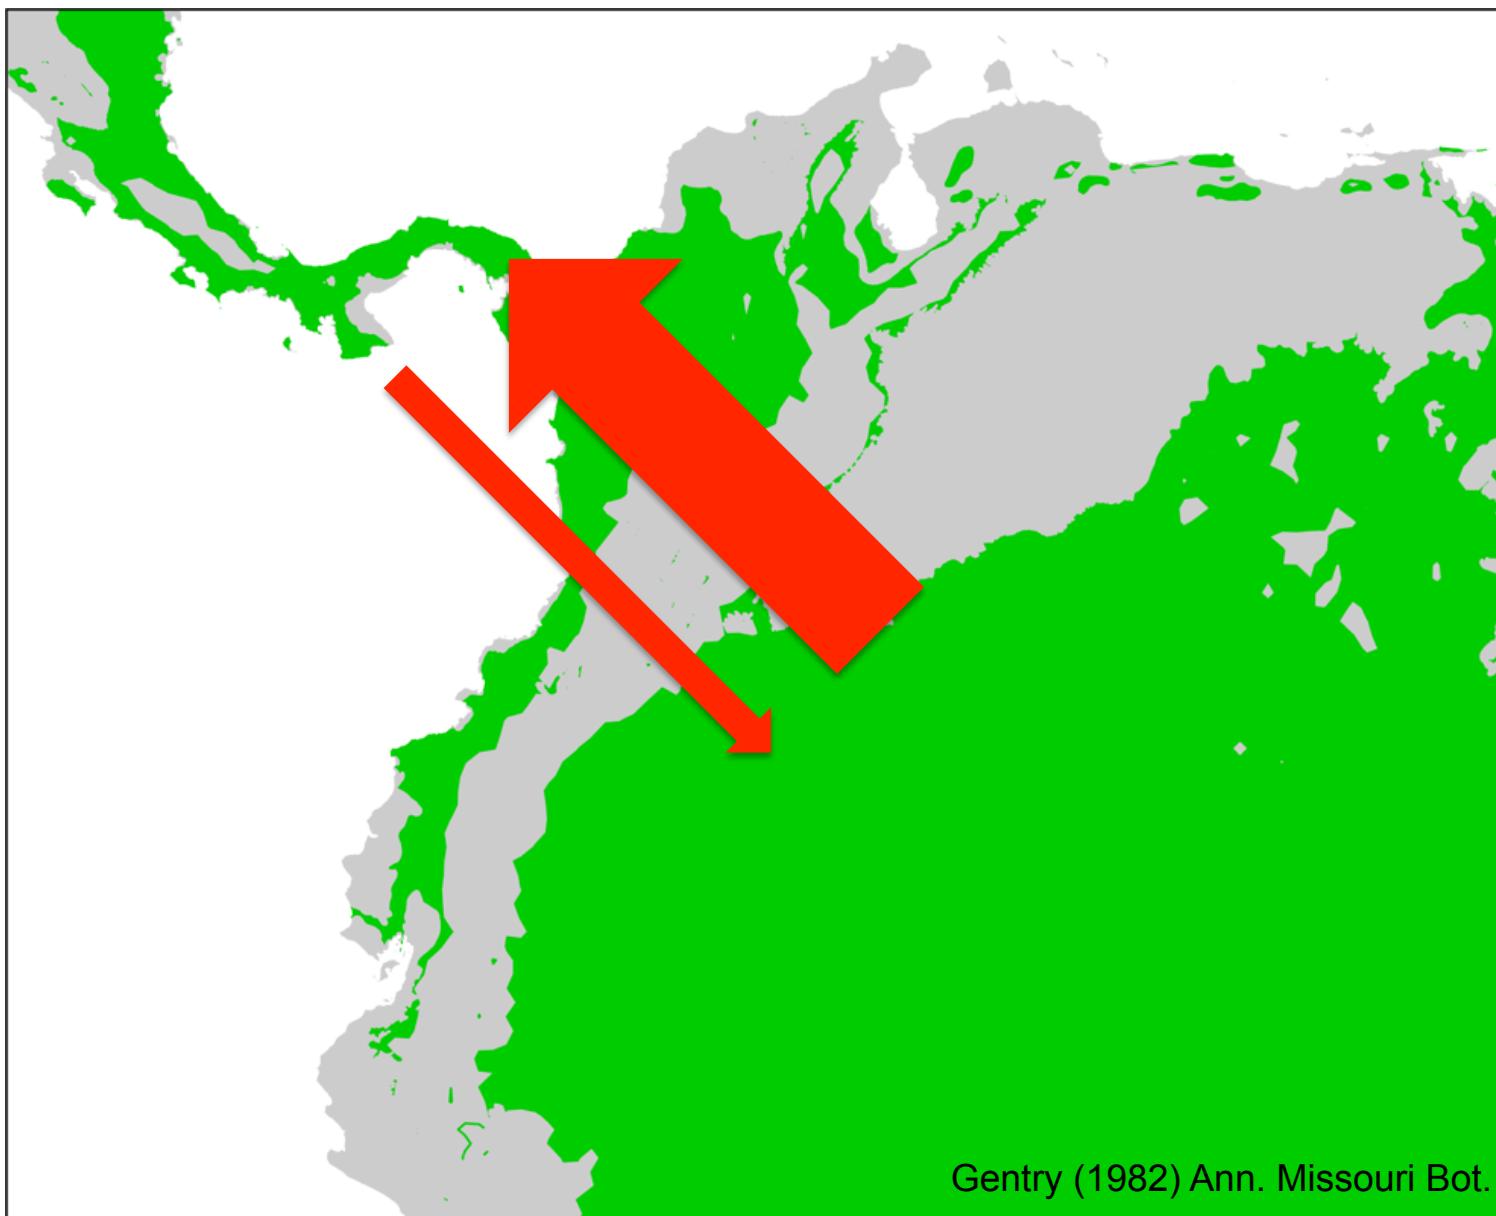

broad elevational  
range

drought  
tolerance

“widespread and weedy”

dispersal-  
colonization

# Filter-dispersal assembly

# Conclusions

- the northern Andes region is a biogeographic filter
- widespread and weedy traits
- filter-dispersal assembly (esp. of Central American rainforests)
- use of digital biodiversity data
  - geographic distributions
  - novel ecological traits (e.g., drought tolerance)

# Automated filtering of GBIF occurrence records

- exclude suspected errors
  - R package *rgbif()* (Chamberlain et al. 2015)
- exclude low-precision coordinates
- spatial thinning
- assume some errors still exist
  - consider only 10-90% of ecological amplitude
  - require min. numbers of unique records

wind:  $p = 0.027$
